Technology Development in the Hokuriku District of Japan for the Production and Distribution of Highly Durable Concrete Mixtures Using High Quality Fly Ash

Author (Development organization)
The Research Committee on the Promotion of Effective Utilization of Fly Ash Concrete in the Hokuriku District

1. Background of development

(1) Background of project

In the Hokuriku district, existing structures are showing signs of ASR (Alkali-Silica Reaction). ASR also is a concern for future structures. The fly ash available in the Hokuriku district has an ASR controlling effect, but due to fluctuations in quality and other reasons, it is not being effectively used. Limited aggregate resources must be used effectively to improve the durability of concrete in order to reduce environmental loads and life cycle costs, as well as promote local consumption of local products. These district issues can be tackled through cooperation among relevant parties. In January 2011, “The Research Committee on the Promotion of Effective Utilization of Fly Ash Concrete in the Hokuriku District,” an industrial, academic, and governmental group, was founded with the aim of establishing a system for reducing quality variations in high quality fly ash and effectively using it in concrete mixtures. Figure 1 shows the committee’s composition. Photo 1 shows a committee meeting that was held.

Committee’s Chair:
Prof. Kazuyuki Torii, Kanazawa University

Academia
- Kanazawa University
- Kanazawa Institute of Technology
- Toyama Prefectural University
- University of Fukui

Industrial
- Toyama Ready-Mixed Concrete Industrial Association
- Ishikawa Ready-Mixed Concrete Industrial Association
- Fukui Ready-Mixed Concrete Industrial Association
- Hokuriku Electric Power Company

Government
- Ministry of Land, Infrastructure, Transport and Tourism
- Toyama prefectural government
- Ishikawa prefectural government
- Fukui prefectural government

Figure 1. Composition of the Committee
2. Summary of technology

(1) Descriptions of technology

The technologies to be developed for the system comprise a technology for classifying and managing the quality of fly ash and a technology for producing highly durable concrete using fly ash. The district’s fly ash producers, concrete manufacturers, and clients are cooperating to establish a system to utilize classified fly ash in the district. Experts are also cooperating. Thus, in addition to solving specific issues, cooperation is being deeply incorporated. This differs from conventional technological development.

(2) Effects of technology

[1] Establishment of quality management and distribution systems for fly ash

At the Nanao-oota Thermal Power Plant in Ishikawa Prefecture and the Tsuruga Thermal Power Plant in Fukui prefecture, the classification of fly ash has begun, and a system to produce and distribute 30,000 tons shipment of high quality, low variability fly ash has been established.

A standard mix proportion for fly ash concrete containing aggregates typically used in the Hokuriku District was prepared.

Toyama prefecture: two aggregates
Ishikawa prefecture: two aggregates
Fukui prefecture: three aggregates

[3] Verification of the durability of concrete made with regional materials

The durability (calorific value, ASR, damage by chloride attack, frost damage, and carbonation control) of the standard fly ash concrete mixed in [2] was compared with concrete containing ordinary cement and concrete containing blast-furnace slag cement. The results demonstrated that concrete mixed with fly ash exhibited...
improved durability that was equivalent to or higher than that of other types of concrete.

Table 1 lists the results of the quality comparison tests on concrete using fly ash.

Drawing on [1] to [3] above, by using concrete mixed with high quality fly ash, the practice of local consumption of local products can not only solve the district’s ASR issue. The effect of reducing construction costs and CO$_2$ emissions can also be expected, thus contributing greatly to the district.

(3) Records of technology application

Reconstruction work on the Kanazawatatsuruhama Line, a principal local road (conversion to four lanes, Uchinada Kaihin Bridge A1 and A2 abutment work) and 37 other projects.

(9,415m³ of fly ash concrete was cast.)

Photo 2 shows construction work. Photo 3 shows the completed work.
